SCRIPT-CONTROLLED ACL

Level 2: Prepare Table and Field

Data Model Setup

1. Create or select the table that contains the records to protect.

2. Add a field such as Department, Region, Status, or Owner Group. Use a consistent field type and controlled values.

3. Create sample records with different field values, such as HR, Finance, and IT.

4. Confirm that the field is populated where access decisions are required. Decide how blank or missing values should be handled.

5. Document the table name, field name, valid values, and intended access rule.
