SCRIPT-CONTROLLED ACL

Level 3: Users and Roles

Identify Access Groups

1. Create test users representing different access situations, such as an HR user, Finance user, and administrator.

2. Assign each test user an appropriate role or group.

3. Define how the user’s permitted field value will be obtained—for example, from a trusted user attribute, group membership, or related profile record.

4. Avoid relying on a value supplied directly by the user in a form or request.

5. Prepare a simple access matrix showing which user should access which records.
