SCRIPT-CONTROLLED ACL

Level 4: Create the ACL

Configure the Access Control

1. Open the platform’s security or ACL configuration area.

2. Create an ACL for the required table and operation, such as read or write.

3. Set the applicable scope and role requirements according to the project design.

4. Enable the script condition, if supported by the platform, and keep the rule limited to the required records and operation.

5. Save the ACL and record its name, table, operation, and configuration. Exact menus vary by platform.
