SCRIPT-CONTROLLED ACL

Level 6: Add Script

Implement the Script Logic

1. Write the ACL script using the platform’s supported server-side scripting syntax.

2. Illustrative logic: allow access only if the current user’s trusted department equals the record’s Department field.

3. Return or set the platform-specific allow/deny result explicitly; do not assume syntax is identical across platforms.

4. Handle null values and unexpected data safely, and avoid exposing sensitive information in logs or error messages.

5. Review the script for least privilege and have it checked by a supervisor or administrator before deployment.
