SCRIPT-CONTROLLED ACL

Level 7: Test the ACL

Verify Expected Access

1. Test with each sample user and records from every department or field category.

2. Check both permitted and denied cases, including blank field values and users without the required role.

3. Test each protected operation separately—for example, read, write, update, and delete where applicable.

4. Confirm that access is denied by default when user or record information is missing.

5. Record expected and actual results, and correct any mismatch before proceeding.
